OUTDATED: Policies concerning the /store/temp and /store/unmerged directories

The following table is outdated. All relevant policies should be taken from DMWMPG_Namespace twiki.

/store/unmerged and /store/temp are special directories which hold temporary files. They can be cleaned up automatically by the sites to free up disk space, but live within the Ops disk allocation at the sites. They should be TOD1 (disk only). The access permissions to the directories is listed below following the VOMS role setup defined here:CompOpsPoliciesVOMSRoles:

directory	description	roles with write permission	accessible through srm (YES/NO)	min file retention time
/store/unmerged	legacy directory holding temporary files and logArchive tarballs	t1production, production, hit1production, h1production	NO (logCollect jobs archive logArchives to CERN, but srm access still would be nice)	2 weeks
/store/temp	new main directory for temporary files	NO ACCESS	NO	2 weeks
/store/temp/prod	new main directory for temporary production files	t1production, production, hit1production, h1production	NO	2 weeks
/store/temp/user	new main directory for temporary user files	every CMS VOMS proxy	YES (asynchronous stageout)	1 week, sites can fail writing to area if it holds more than 20 TB

The srm accessibility should guarantee that what really needs access through srm is defined. Of course all other areas would benefit from SRM accessibility.
