

What to do if CMS SAM test for Squid fails

- the obvious thing is to look at server logs and run a local test as indicated in squid installation instructions[?]
- some not-so-obvious problems that have been reported are
 - ◆ farm was reconfigured, with new subnet, and the list of allowed subnets in squid was not updated
 - ◆ squid cache was corrupted. This should be reported in squid's cache.log file, a 'squid -z' command will be needed, see installation instructions[?]. Note that the version of the installation tarball 2.0rc3 and later (see <https://twiki.cern.ch/twiki/bin/view/CMS/SquidForCMS>) should detect the corruption and automatically recover from it
- any new squid problem should be reported to <mailto:cms-frontier-support@cernNOSPAMPLEASE.ch>
- the contact for help on the CMS Frontier tools and Squid is <mailto:cms-frontier-support@cernNOSPAMPLEASE.ch>
