# Observation of Long-Range, Near-Side Angular Correlations in Proton-Proton Collisions at the LHC

## Abstract

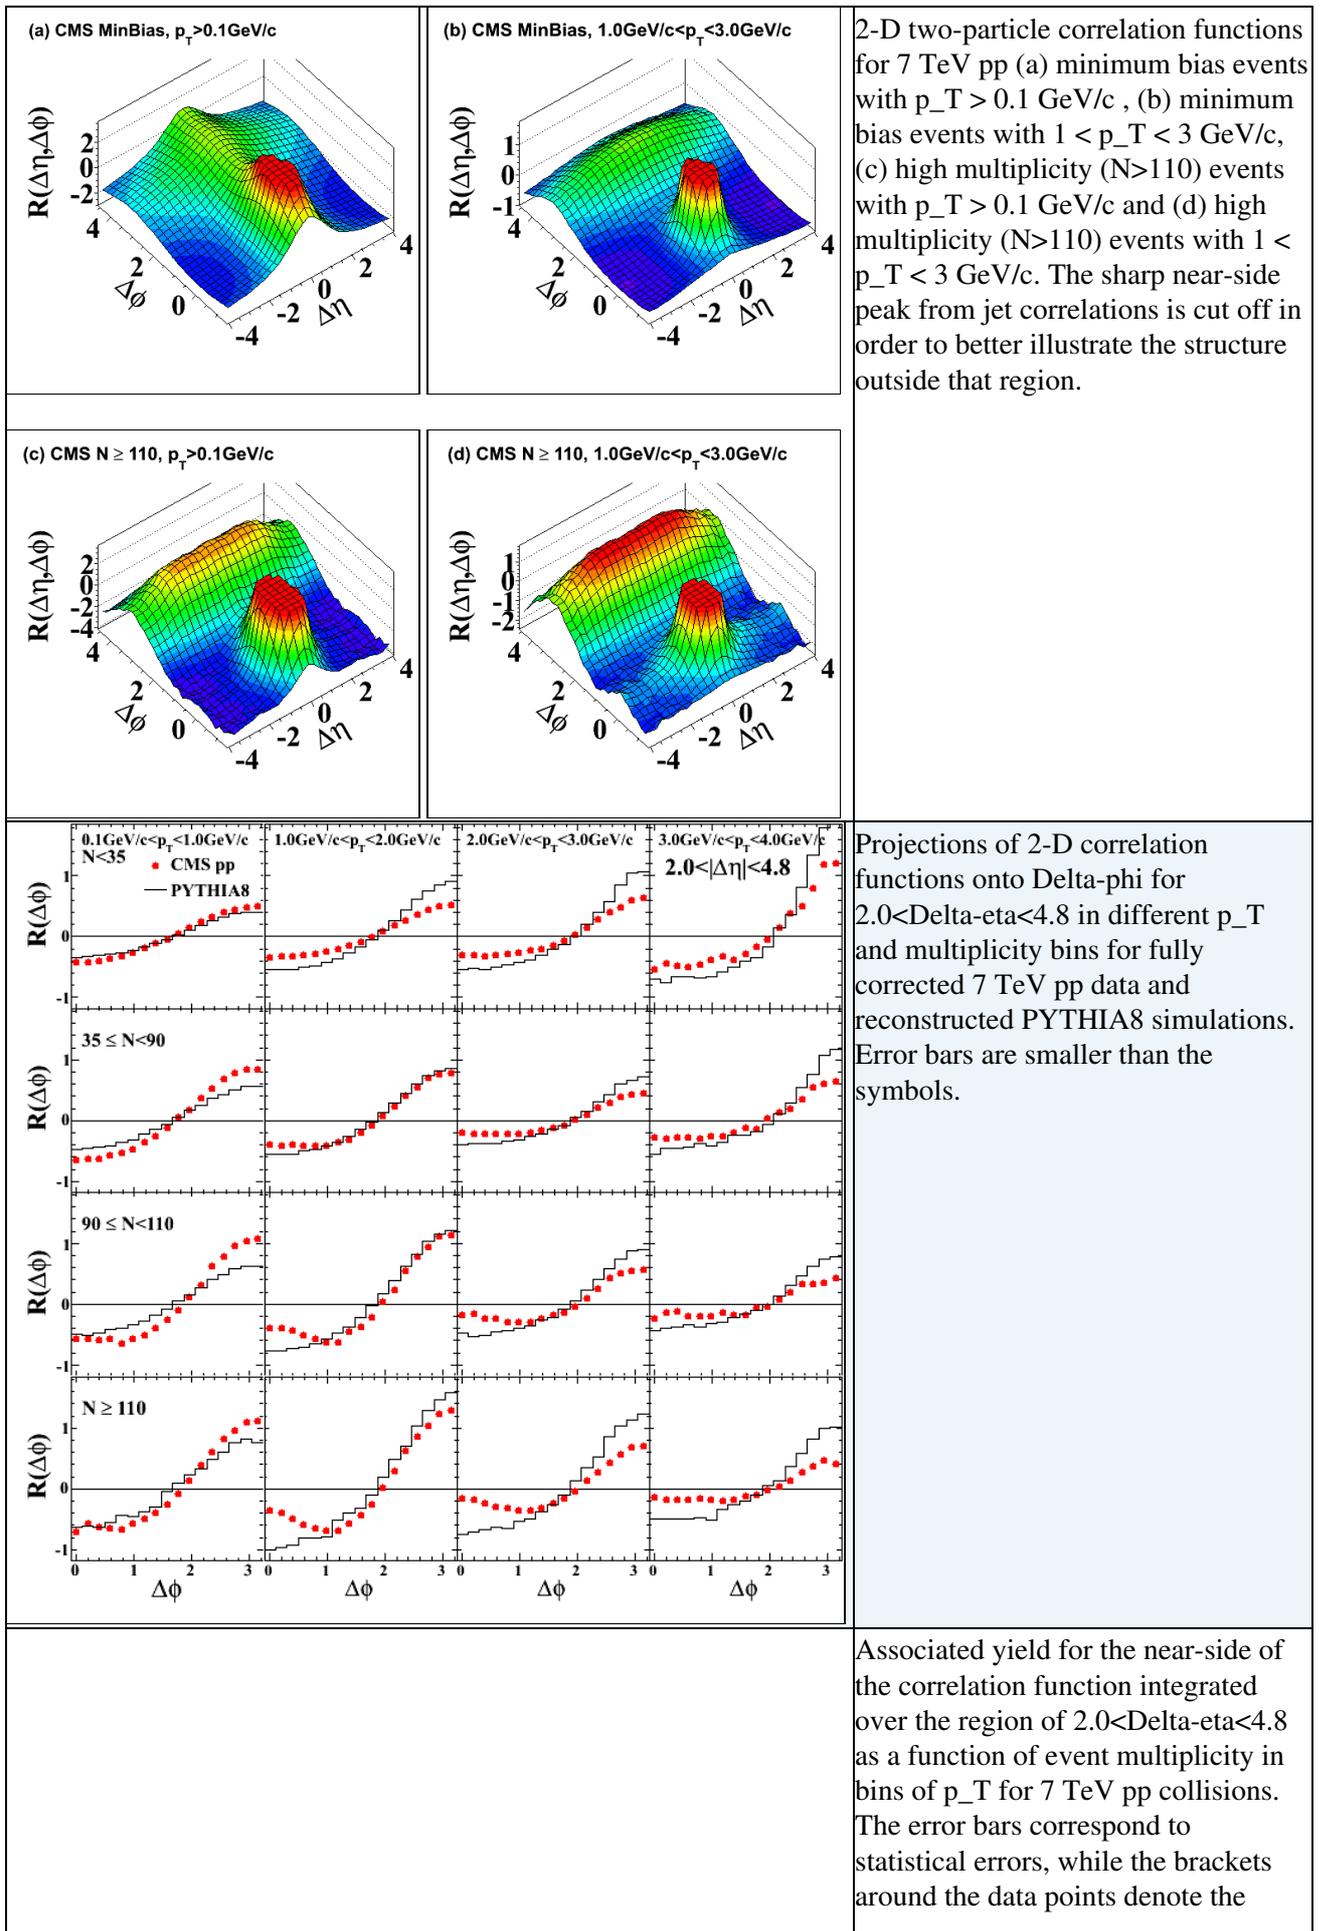

Results on two-particle angular correlations for charged particles emitted in proton-proton collisions at center-of-mass energies of 0.9, 2.36, and 7 TeV are presented, using data collected with the CMS detector over a broad range of pseudorapidity( $\eta$ ) and azimuthal angle ( $\phi$ ). Short-range correlations in  $\Delta\eta$ , which are studied in minimum bias events, are characterized using a simple "independent cluster" parametrization in order to quantify their strength (cluster size) and their extent in  $\eta$  (cluster decay width). Long-range azimuthal correlations are studied differentially as a function of charged particle multiplicity and particle transverse momentum using a 980  $\text{nb}^{-1}$  data set at 7 TeV. In high multiplicity events, a pronounced structure emerges in the two-dimensional correlation function for particle pairs with intermediate  $p_T$  of 1-3 GeV/c,  $2.0 < \Delta\eta < 4.8$  and  $\Delta\phi \sim 0$ . This is the first observation of such a long-range, near-side feature in two-particle correlation functions in pp or p

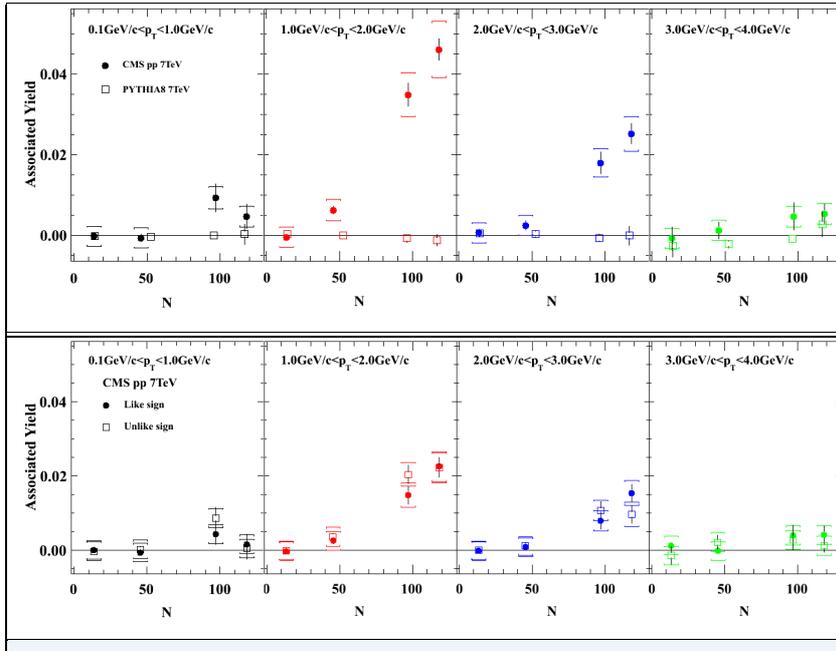

bar collisions.

	<p>Two-particle correlation functions versus Delta-eta and Delta-phi in PYTHIA D6T tune at (a) 0.9, (b) 2.36, and (c) 7 TeV.</p>
	<p>Two-particle pseudorapidity correlation function, obtained by averaging over the entire Delta-phi range from 0 to pi, in pp collisions at (a) 0.9, (b) 2.36, and (c) 7 TeV. The solid curves correspond to the fits by the cluster model. Error bars are smaller than the symbols.</p>
	<p>(a) <math>K_{\text{eff}}</math> and (b) <math>\delta</math> as a function of energy, measured for <math>p_T &gt; 0.1</math> GeV/c and <math> \eta  &lt; 2.4</math> by CMS in solid circles. Open circles show the PYTHIA results with the D6T tune.</p>
	<p>(a) <math>K_{\text{eff}}</math> and (b) <math>\delta</math> as a function of energy based on a model-dependent extrapolation of CMS data to <math>p_T \sim 0</math> and <math> \eta  &lt; 3</math> (solid circles), as well as data from PHOBOS (solid squares), UA5 (solid triangles) and ISR (solid stars) experiments for pp and ppbar collisions. Open circles and squares show the PYTHIA results for the D6T tune and default parameters, respectively.</p>

systematic uncertainties. The open squares show results for PYTHIA8.

Like-sign and unlike-sign associated yield for the near-side of the correlation function integrated over the region of  $2.0 < \Delta\eta < 4.8$  as a function of event multiplicity in bins of  $p_T$ . The error bars correspond to statistical errors, while the brackets around the data points denote the systematic uncertainties.
