

**Engineering Management Team (EMT):** is lead by the Release Manager and composed of the Product Team Leaders (or duly appointed representatives), a QA representative, a Security representative, representatives of the Operations teams of the major infrastructures (EGI, PRACE, etc.) and invited experts as necessary. The role of the EMT is to manage the release process and the 'standard' changes, that is all the changes that are pre-approved based on established policies and do not need to be individually approved by the PEB or the PTB. This includes software defects triaging and prioritization, technical management of releases, integration issues, and user support request analysis. The EMT is therefore the natural aggregation point for all PTs to discuss practical integration and release issues and is adapted to the largely distributed nature of the project. This mechanism has been already successfully employed in other very distributed projects like EGEE III. The Release Manager reports to the SA1 Work package leader.
