Installing a central Frontier 'launchpad' server

A Frontier 'launchpad' server runs both the frontier-tomcat package to do the HTTP to database translations and a special configuration of the frontier-squid package to cache results locally. The server is called a "launchpad" because the term "Frontier server" is ambiguous; sometimes people mean the tomcat process and sometimes they mean the machine. Each launchpad also runs a frontier-awstats monitoring package.

- Instructions for installing frontier-tomcat
- Instructions for installing frontier-squid on a launchpad
- Instructions for installing frontier-awstats
