Deployment Review

This document is the output of the Deployment working group: Mike, Pablo and Paloma.

As requested in the WLCG monitoring consolidation meeting 18 July 2013 [\[2\]](#), we attempt to answer the following questions regarding deployment:

- Are we doing things consistently for all of our applications?
- If we are doing things in multiple ways, is there a good reason for it?
- Are there any new technologies that would help us here?
- How long would it take to change?
- How would that impact the other layers?

Are we doing things consistently for all of our applications?

- Dashboard
 - ◆ Quattor
 - ◆ Dashboard Build Server
 - ◆ sindes
- SAM
 - ◆ EGI koji
 - ◆ Quattor (being replaced by yum)
 - ◆ YAIM

If we are doing things in multiple ways, is there a good reason for it?

Historical reasons

Are there any new technologies that would help us here?

Puppet (AI)

TrackingTools

How long would it take to change?

There are several groups working with Puppet in IT (knowledge + experience). In principle, two months should be enough to have the prototypes ready.

How would that impact the other layers?

Transparent to other layers
