

LCG Grid Deployment - gLite PPS -SFT Test Suite in Pre-Production

The following should be consider abnormal situations

## Stale data

The SFT suite is launched every hour by a cron job, so if the results are older than one hour there is a problem. The problem could be with the site itself, with the publishing of the results or could be a network problem.

## 0 sites matching

The SFT uses RGMA to get the list of possible CEs. When in the logs you see "Found 0 sites matching" there is usually a problem in the gocdb-xfer python script, the script that reads data in the gocdb and publishes them in RGMA. If the problem were with RGMA itself you would see a failed connection to the RGMA server
