How to use the Moore_RateTest script

The script lives in the DBASE package, PRConfig. You can see it here or it in webspn. You can refer to these slides for some examples on how to use the tool. It is visible to a Moore environment, e.g. lb-run Moore/prod cat 'PRCONFIG/python/MooreTests/Moore_RateTest.py'. Many of the common uses of the Moore_RateTest are tested with nightly qmtests, which are configured here.
List of example instructions

Please let us know if you have a use case that isn't covered by the following list of examples. The recommended example for line development is this one.

Example: Using trigger-dev to test the HLT2 line rate with HLT1 filtered input data.

This is the recommended example for testing the rate of your development HLT2 line for 2017 datataking. Check the comprehensive up-to-date instructions at https://gitlab.cern.ch/lhcb-HLT/trigger-dev

code:

```bash
source /cvmfs/lhcb.cern.ch/group_login.sh -c x86_64-centos7-gcc62-opt
# use CVMFS with the correct gcc version
cd /afs/cern.ch/work/X/USERNAME/
git clone ssh://git@gitlab.cern.ch:7999/lhcb-HLT/trigger-dev.git workspace

cd workspace

# Clone PRConfig
mkdir DBASE &&
cd DBASE

# Build and run the test
export LC_ALL=C
make
# do not add -j
Moore/run python DBASE/PRConfig/python/MooreTests/Moore_RateTest.py --inputdata=2018_Hlt1_0x11751801 --L0TCK=0x1801 --evtmax=1000 --input_rate=110.e3 | tee Moore_RateTest.log
```

Example: Testing the rate of your development HLT2 line with the production version of Moore, and HLT1 filtered input data.

This is the default example for testing the rate of your development HLT2 line for 2018 datataking. This example for 2017 was tested in LBHLT-138 and a log file is attached there in case you want to compare with your test.

code:

```bash
$lb-dev --list Moore
lb-dev --name=RateTest Moore/prod
cd RateTest
# the following would be if you want to make some changes, e.g. to the settings or lines
#git lb-use Hlt
#git lb-checkout Hlt/2018-patches Hlt/HltSettings
#git lb-checkout Hlt/2018-patches Hlt/Hlt2Lines
mkdir DBASE &&
cd DBASE

git lb-clone-pkg PRConfig
cd ..

export LC_ALL=C
make -j 4
./run python DBASE/PRConfig/python/MooreTests/Moore_RateTest.py --inputdata=2018_Hlt1_0x11751801 --inputdata=2018_Hlt1_0x11751801
```

Example: Measure the rate w.r.t. L0 filtered data while tuning some HLT2 lines with the Moore v26r0 release.

```bash
lb-dev Moore v26r0
cd MooreDev_v26r0

getpack Hlt
git lb-checkout Hlt/master Hlt/HltSettings

getpack PRConfig head
make -j 4

./run python PRConfig/python/MooreTests/Moore_RateTest.py --evtmax=10000 --inputdata=2016NB_25ns
# make some changes
```

List of example instructions
Example: Run straight from a nightly or release build without lb-dev

lb-run --nightly lhcb-head [DAY] Moore/HEAD python "$PRCONFIGROOT/python/MooreTests/Moore_RateTest.py"

Example: Measure signal efficiencies

First of all, we need to prepare a suitable signal MC sample.

1. It should be juggled to look like raw data. Here is an example script: jugglesstep.py.txt. For changing the example script to your data you might have to change the input version (2.0 can be used for most MC) together with the input location.
2. Then you should rerun L0 using L0App with
3. Then you should run the Moore_RateTest script with the --mode='efficiency' option.

There is a sample of juggled \( D^+ \to D^0 \pi^+, D^0 \to K^+ \) 2015, Sim08, MC in the testfile db under "Juggled_MC_2015_27163003_DstToD0pip_D0ToKmPip". Steps 2 and 3 are tested using a small number of events from this sample in the nightlies. If you encounter any problems with this script, please first look here to see if the nightly test is OK. Aside: If you are developing Hlt code, then it is expected that you regularly follow the nightly tests.

Please note: Not all MC samples contain the full raw event information which is needed to run L0 and Moore. A description of all file types can be found here.

Please note that you can also use conddb and simdb tags directly, as noted by Mika:

You can replace \( \text{TFDBForTags=XYZ} \) by settings the tags explicitly

https://svnweb.cern.ch/trac/lhcb/browser/DBASE/trunk/PRConfig/python/MooreTests/Moore_RateTest.py#L135
https://svnweb.cern.ch/trac/lhcb/browser/DBASE/trunk/PRConfig/python/MooreTests/Moore_RateTest.py#L129

Log files from this example are here

- For the RedoL0 step,
- And the interesting part for the Moore_RateTest step (Full log).

Example: Measure the rate w.r.t. L0 filtered data while tuning some HLT2 lines with the Moore v26r0 release
