CoralServer tests

There are currently two sets of tests for the CoralServer software:

- The CORAL and COOL qmtest test suites contain some tests that are executed against a centrally maintained CORAL server, both as part of the nightlies and during the release validation process. These tests are described in the [PersistencyReleaseProcess](#) page. They are executed against a server hosted on `coralsrv01` in the persistency cluster (see [PersistencyTestServers](#)).
- Other standalone tests involve the startup and shutdown of custom CORAL servers and proxies on the client node itself. These tests are executed as part of the release validation process, but not during the nightlies. They are described in the [PersistencyReleaseProcess](#) page.
