

Question

How to rename a topic in a web with the option to look for references in all webs?

When I try to use the all webs option it takes a long time and then I end up with an error message: *Internal Server Error, The server encountered an internal error or misconfiguration and was unable to complete your request... ..More information about this error may be available in the server error log.* For example at 2008.01.17 11.17 or 18

Environment

Web Browser:	IE
User Location:	Internal
Categories:	Fatal error, Performance

Answer

▲ If you answer a question - or have a question you asked answered by someone - please remember to edit the page and set the status to answered. The status is in a drop-down list below the edit box.

Hi Peo,

This is a pretty resource demanding operation, but it used to work in the past. We will look into it. Meanwhile, please use the option: "Look for references in this web only", which should be appropriate for your case.

Some web administrators have set access control settings to limit rename/delete of topics. View the WebPreferences in your web to check these.
