

## CALCULATE{"formula"} -- handle spreadsheet calculations outside tables

- The %CALCULATE{formula}% variable is handled by the SpreadSheetPlugin. Over 100 functions are available, such as \$ABS (), \$EXACT (), \$EXISTS (), \$GET ()/\$SET (), \$IF (), \$LOG (), \$LOWER (), \$PERCENTILE (), \$TIME (), \$VALUE ().
  - Syntax: %CALC{formula}%
  - Examples:
    - ◆ %CALC{\$EXISTS (Web.SomeTopic) }% returns 1 if the topic exists
    - ◆ %CALC{\$UPPER (Collaboration) }% returns COLLABORATION
  - Note: The CALCULATE variable is handled inside-out & left-to-right like ordinary TWiki variables, but it does *not* support functions that refer to table cells, such as \$LEFT () or \$T (). Use CALC instead.
  - Category: DevelopmentVariables, TablesAndSpreadsheetsVariables
  - Related: CALC, IF, IfStatements, SpreadSheetPlugin
