

ENV{"varname"} -- inspect the value of an environment variable

- Returns the current value of the environment variable in the CGI (Common Gateway Interface) environment. This is the environment that the TWiki scripts run in on the web server.
 - **Note:** For security reasons, only those variables whose names match the regular expression in `{AccessibleENV}` in the **Security Settings/Miscellaneous** section of `configure` can be displayed. Any other variable will just be shown as an empty string, irrespective of its real value.
 - **Example:** `%ENV{MOD_PERL}%` displays as: not set
 - If a variable is undefined (as against being set to the empty string) it will be returned as `not set`.
 - Related: `HTTP_HOST`, `REMOTE_ADDR`, `REMOTE_PORT`, `REMOTE_USER`
-
