The graph shows the average number of roads per tower plotted against the number of collisions per bunch crossing. The estimated dataflow limit is indicated by a dashed line. The graph is labeled "ATLAS simulation Preliminary" and includes the expression for ternary bits: $(1+1)_{pix} (3)_{sct}$. The data corresponds to the process $pp \rightarrow t\bar{t}X$ at $\sqrt{s} = 13$ TeV for both barrel and endcap towers.
