

Distribution of the OTx optical spectrum width as a function of the OTx serial number for the 1532 FEBs installed on the detector. The OTx optical spectra were measured a few times since summer 2009 and the widths have been found to be stable. The black squares indicate the OTx which failed since September 2009 (after the first campaign of measurement). The red squares indicate the OTx of FEB which have preemptively been exchanged during this shutdown.

There are two populations ($s/n < 2500$ et $s/n > 4000$) which show two OTx productions batches.
