

# Some notes about the worker nodes

## Worker Node Reboot

### **condor.boot.sh script**

The file `/etc/init.d/condor.boot` in any worker node is responsible for the shutdown of the worker node after a job finish.

### **balancer.sh script**

The script `/opt/etics/pool_balancer/balancer.sh` located on the Etics server is responsible for taking a stopped machine, revert it to the original checkpoint and start the machine if necessary. On the pool we have at least one machine active of each type. All the definitions of the pool balancer are located on the file `balancer.py`
